Hiring Manager
Parsons
MacDill Air Force Base
Tampa, FL

Dear Hiring Manager,

I am applying for the Software Developer position at Parsons. I bring full-stack experience supporting mission-critical aerospace and defense systems, along with application development in financial services. My background includes React and TypeScript interfaces, Java/Spring Boot services, Python UI applications, software requirements, and secure CI/CD delivery. I am especially interested in contributing to Parsons' work developing and integrating mission-critical software for national cybersecurity and defense operations.

At JPMorgan Chase, I developed React and TypeScript front-end components and Java/Spring Boot microservices using test-driven development. I deployed services to Kubernetes, created an administrative tool that streamlined file management, reviewed pull requests, and provided Level 3 production support by diagnosing and resolving critical issues.

In my current role at Collins Aerospace, I write and refine software requirements and develop, integrate, and test software for mission-critical aerospace and defense systems. I build multiple Python UI applications in parallel with Qt Designer, tailoring them to distinct customer workflows and collaborating with software and systems engineers to test integrations with hardware and simulators. I also lead DevOps work maintaining CI/CD pipelines for applications written in multiple languages, and manage CloudStack instances and images in an air-gapped network. This work has strengthened my experience with React and TypeScript, Java, Python, software requirements, system integration and testing, Git, and CI/CD and secure software delivery in a SCIF environment.

I would welcome the opportunity to discuss how my full-stack development, requirements, integration, and secure-delivery experience could contribute to Parsons's work at MacDill Air Force Base. Thank you for your consideration.

I hold an active DoD Top Secret (TS) clearance and bring experience developing software in secure, mission-critical environments.

Sincerely,
Ilya Aronov

Full Stack Developer
